

PROJECT REPORT: USER RESEARCH & FEASIBILITY STUDY

Project Name

QuickPay – Fintech Mobile Wallet App

Domain

Financial Technology (UI/UX)

Target Audience

College Students and Young Working Professionals (18–35 Years)

1. Introduction

QuickPay is a fintech mobile wallet application designed to simplify digital payments through a clean, fast, and user-friendly interface. The project focuses on improving the overall user experience by reducing navigation complexity and providing a smooth payment process. The aim is to make peer-to-peer (P2P) money transfers quick, secure, and stress-free.

2. Problem Statement

Many existing banking and digital wallet applications contain cluttered dashboards, excessive promotional banners, and complicated navigation. These issues make it difficult for users to perform simple tasks such as sending money quickly.

The major problems identified are:

- Cluttered home screens with unnecessary promotions.
- Difficulty locating important features like **Send Money** and **Scan QR**.
- Lack of proper transaction status during payment processing.
- Hidden charges and confusing payment workflows.
- Poor user confidence during delayed transactions.

QuickPay aims to solve these problems by providing a minimalist interface with faster navigation and clear transaction feedback.

3. User Research Methodology

User research was conducted through interviews and surveys involving college students and young working professionals who regularly use digital payment applications.

Research Findings

- Users prefer simple interfaces with fewer distractions.
- Most users perform multiple small-value transactions every day.
- Clear transaction confirmation improves user confidence.
- Users expect quick access to frequently used payment options.
- Personalized transaction notes are useful for tracking expenses.

Key Pain Points

- Promotional advertisements hide important payment options.
- Users become anxious when payment confirmation is delayed.
- Existing applications provide confusing technical error messages.
- Lack of an easy method to identify the purpose of previous transactions.

4. User Persona

User Details

- **Name:** Suresh Kumar
- **Age:** 24 Years
- **Occupation:** Junior IT Associate
- **Location:** Urban City
- **User Type:** Daily Digital Payment User

Goals

- Transfer money within a few seconds.
- Split food and travel expenses easily.
- View transaction history in a simple format.
- Complete payments securely with minimum effort.

Frustrations

- Application crashes during poor internet connectivity.

- Technical error messages are difficult to understand.
 - Slow payment confirmation increases stress.
 - Complex navigation wastes time.
-

5. User Flow and Task Analysis

The primary task of the application is sending money to another user.

Step 1 – Login

- User opens the application.
- Authentication is completed using biometric verification or PIN.

Step 2 – Select Recipient

- User selects **Send Money**.
- Searches a contact using name or mobile number.
- Frequently used contacts are displayed for quick selection.

Step 3 – Enter Amount

- User enters the payment amount.
- Optional transaction note can be added.
- System validates the entered amount and available wallet balance.

Step 4 – Payment Confirmation

- User enters the secure UPI PIN.
 - Transaction is processed securely.
 - A confirmation screen displays the successful payment with transaction details.
-

6. Competitive Analysis

A comparison was made with existing payment applications to identify strengths and weaknesses.

Application	Strengths	Weaknesses
Legacy Banking App	High security and trusted services	Complicated interface and slow navigation

Application	Strengths	Weaknesses
Popular Digital Wallet	Large merchant network and payment options	Too many advertisements and promotional content
QuickPay	Minimal interface, quick navigation, instant feedback	Requires onboarding for advanced financial features

7. Feasibility Study

Technical Feasibility

The application can be developed using modern mobile technologies and secure payment APIs with biometric authentication.

Operational Feasibility

The simple interface reduces learning time, allowing users to complete transactions quickly and efficiently.

User Feasibility

The design meets the expectations of digital-native users by focusing on speed, clarity, and ease of use.

8. Conclusion

The User Research and Feasibility Study demonstrates the need for a simplified fintech application that prioritizes usability and user confidence. The research identified several challenges in existing payment applications, including navigation complexity, delayed feedback, and information overload. QuickPay addresses these issues by providing a clean interface, streamlined payment flow, and clear transaction status updates. The findings from this study will guide future UI/UX design decisions and help create a secure, efficient, and user-friendly digital payment experience.
